

Automatic Composition in IoT Systems

Yehia Elkhatib

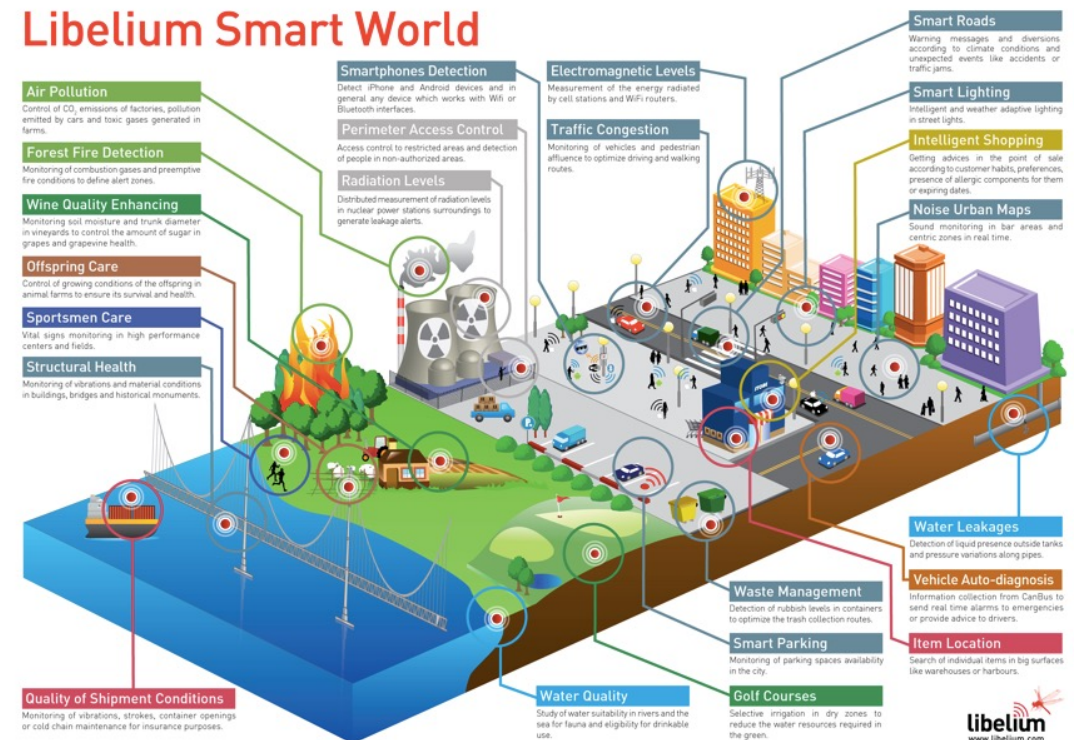

The Rise in IoT Uptake

- Technological advances
 - system-on-chip design and manufacturing
 - devices are highly available, affordable, small, power-efficient
 - network connectivity: LTE, 5G, WiFi, Zigbee, LoRaWAN
- Great progress in deploying applications over various fabrics
 - in situ sensing and actuating devices
- Lots of interesting verticals

https://www.libelium.com/libeliumworld/top_50_iot_sensor_applications_ranking/

<https://www.statista.com/statistics/1183457/iot-connected-devices-worldwide/>

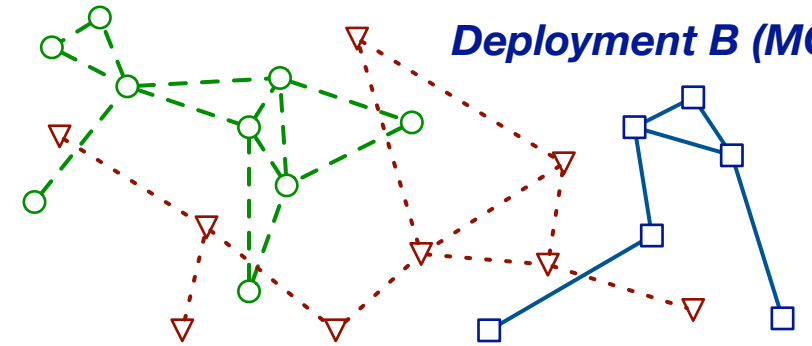

Problem Statement

- A variety of constituent systems
 - independently deployed
 - use proprietary APIs + data formats
 - co-exist in shared physical spaces
- Challenge:
 - heterogeneity makes it difficult to design, maintain and adapt *integrated systems*
 - system developers are overwhelmed with the amount of knowledge they need to acquire
 - difficult to future-proof applications for opportunistic interaction with other systems

Deployment A (UPnP)

Deployment B (MQTT)

Deployment C (CoAP)

Approach Overview

- *Can we get IoT systems to talk to each other post-deployment?*
 - Yes, with a bit (lot!) of effort
- *How?*
 - Create a means to describe systems
 - Describe systems
 - Discover systems
 - Reason about composition
 - oh! and get users to write abstract workflows
 - ...and sometimes we need to deploy mediators
- *Still more work to do?*
 - Always

High-level Vision

Problem and Solution

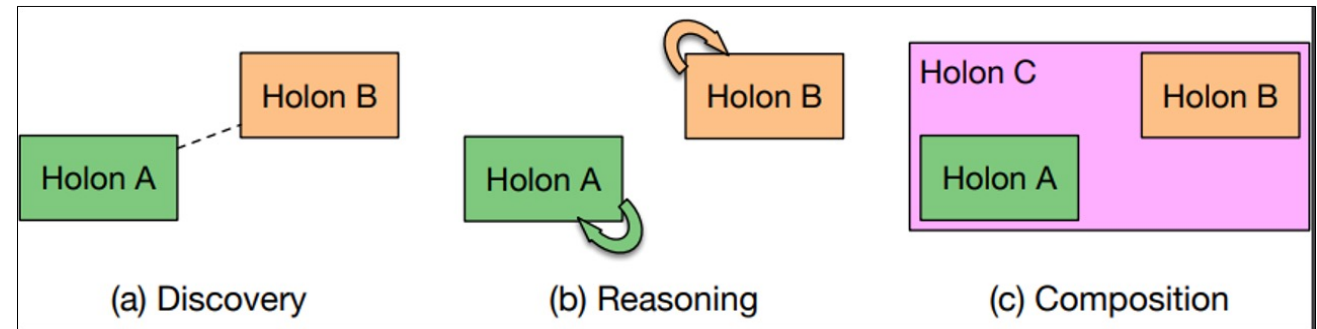

Problem and Solution

Holon?

- A *holon* is a self-describing system that appears as a whole when viewed from above whilst potentially comprising multiple subsystems when viewed from below
- A holon is described using an *ontology* that can be
 - advertised
 - discovered
 - used to reason about opportunistic composition

What is an ontology?

- An ontology is an abstract model of the world, or some domain
- An ontology introduces a vocabulary that is relevant to the domain
 - Explicitly defines concepts, properties, relations, and constraints

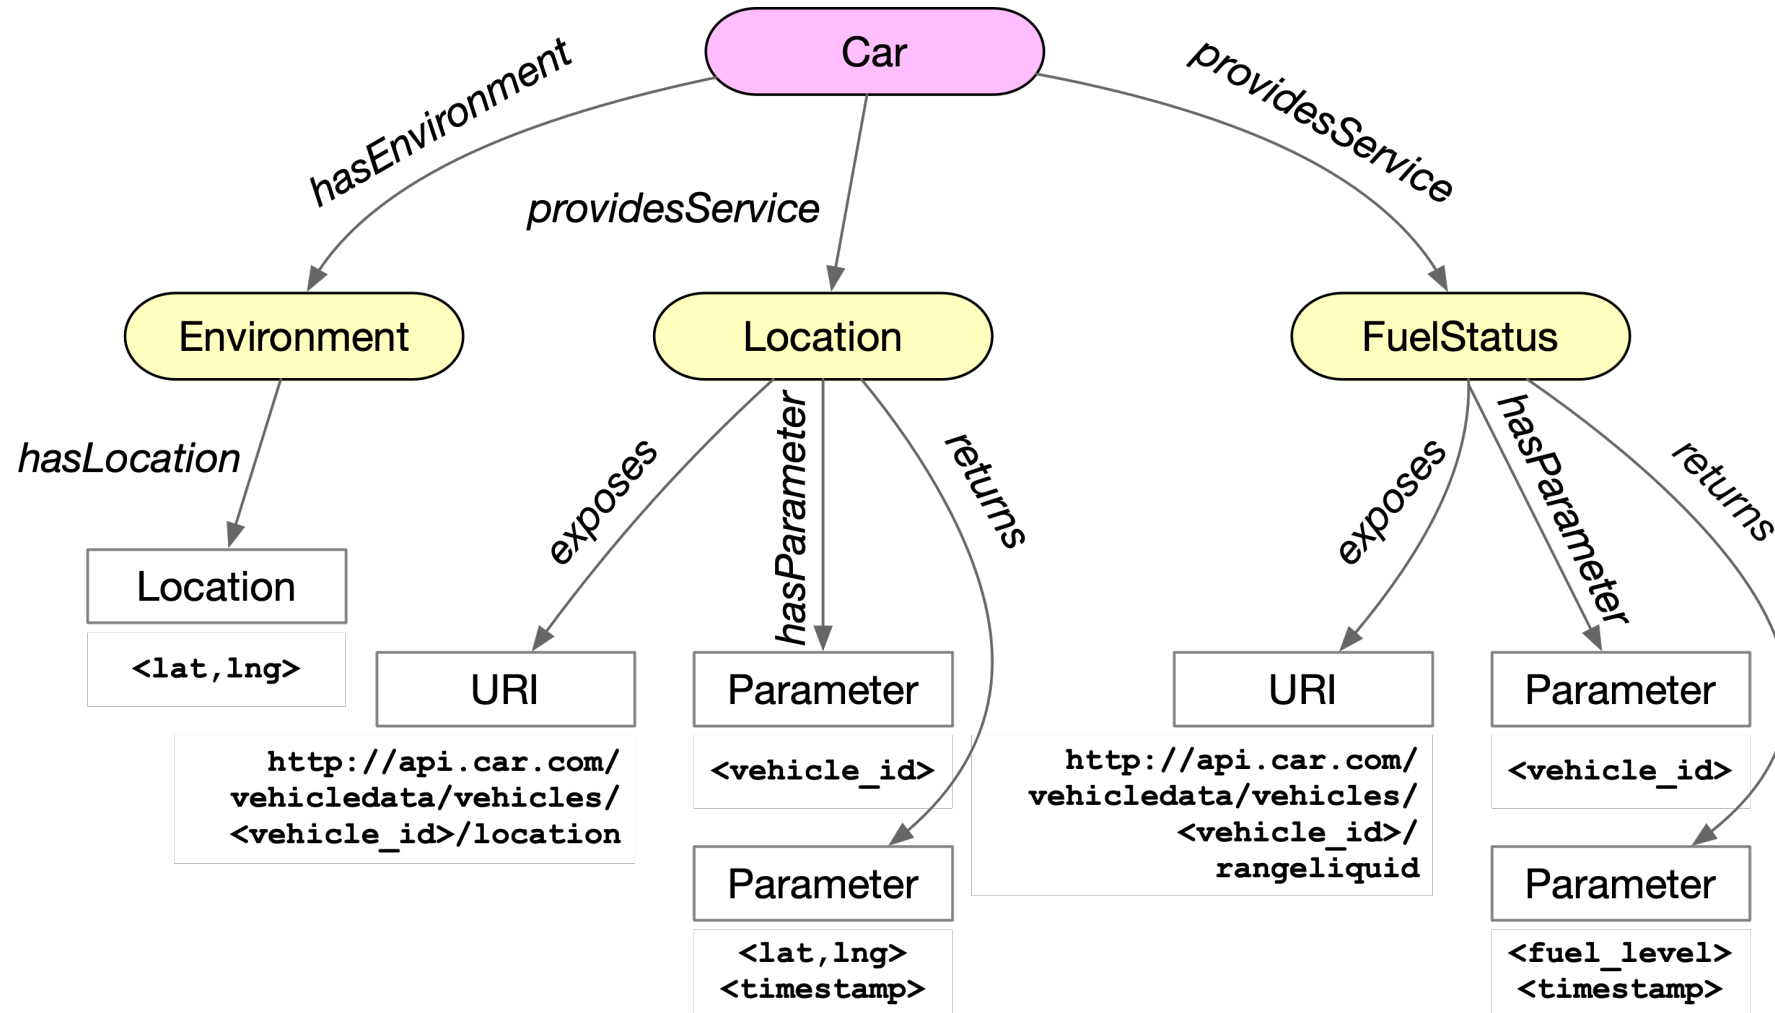

Specifying a Holon

- **HOLON:**
 - has parent (**holon**); has children (**holons**); supports **services**
 - Membership **properties**: has Children, is Member
 - Physical **properties**: power level; location; mobile; firmware; ...
- **SERVICE:**
 - requires properties; desires properties; guarantees properties; may provide properties; exposes API
- **PROPERTY:** (*domain-specific*)
 - e.g. smart home: sensing temperature, humidity, motion; data storage; controlling climate, doors, windows, curtains; ...

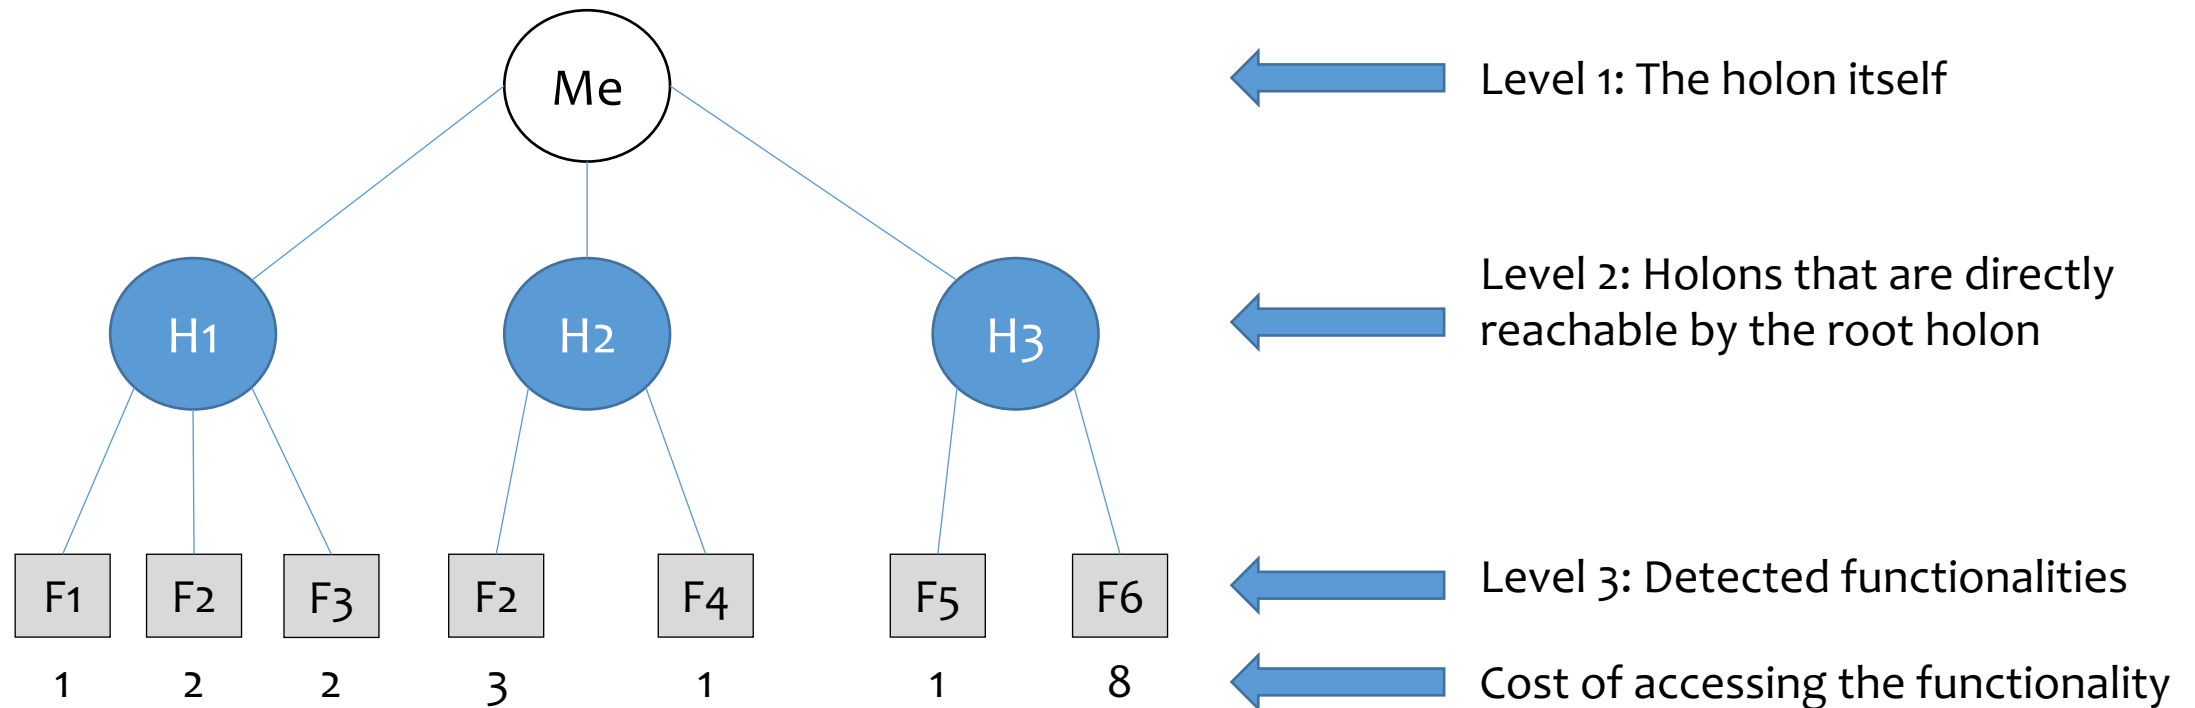

(1) Device identification

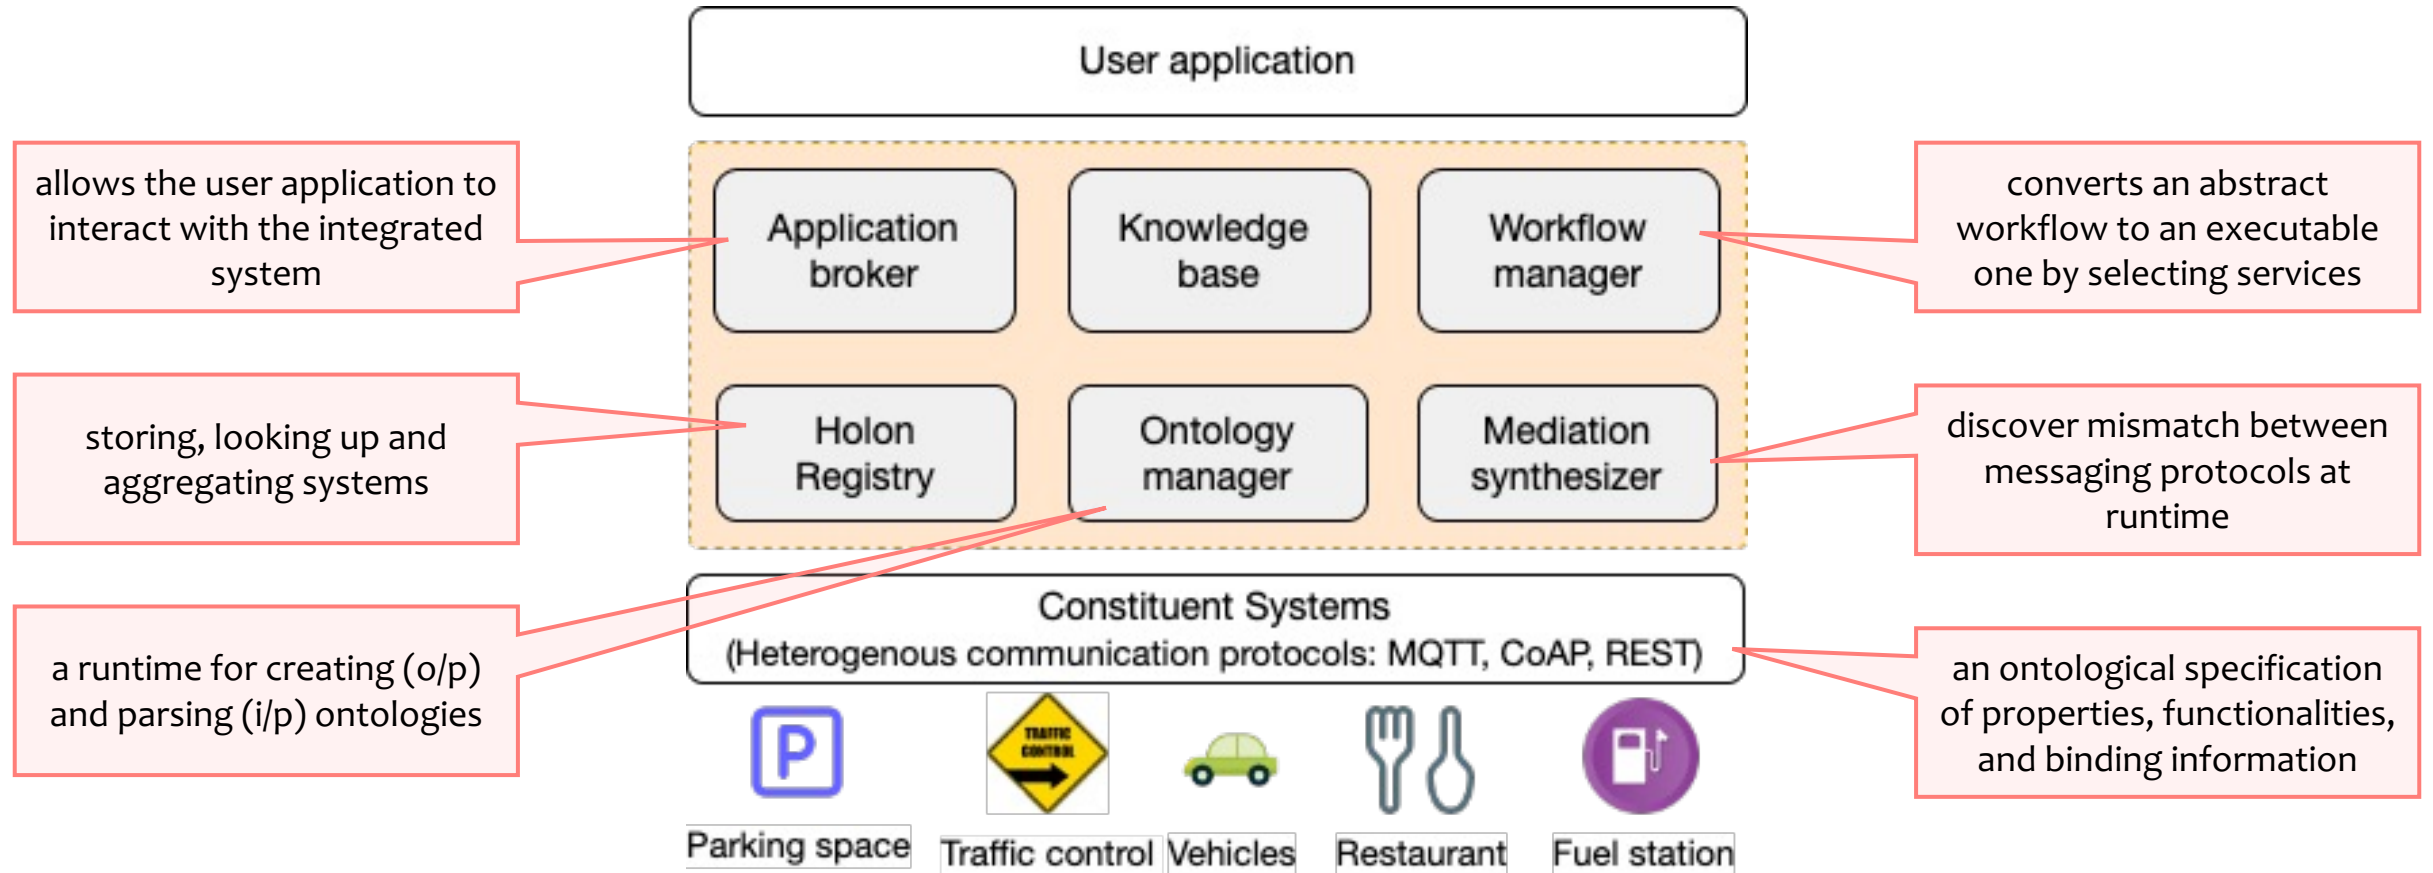

Composition

- The composition model is represented as a weighted tree of depth three

Hetero-Genius Architecture

Sample Response – Classical

```

String vehicleId = "123";
int fuelThreshold = 111;
Location locationToNavigate; //assume Location data format exists
String token = ""; //authentication todo
String resultFuel = call("https://api.mercedes-benz.com/vehicledata/v2/vehicles/vehicleId/resources/rangeliquid", token);
int factFuel = JsonParser.parse(resultFuel).get("rangeLiquid").get("value");
if (factFuel <= fuelThreshold) {
    String location = "" //find location todo
    String resultStations = call("https://api/alt-fuel-stations/v1/nearest.format?parameters", location);
    double factLatitude = JsonParser.parse(resultStations).get("latitude");
    double factLongitude = JsonParser.parse(resultStations).get("longitude");
    locationToNavigate = find(factLatitude, factLongitude); //assume find function exists
}
String resultRestaurants = call("https://foodbukka.herokuapp.com/api/v1/restaurant");
String[] factResuatrants = JsonParser.parse(resultrestaurants).get("businessName");
String selectedRestaurant;
if (selectedResuarant.equals("Foodfusion") {
    String FoodfusionToken = "";
    String restaurant = "Foodfusion";
    int noOfPersons = 1;
    Date bookingFrom = Date.now;
    String resultFoodfusion = call("https://foodfusion/booking", FoodfusionToken, restaurant, noOfPersons, bookingFrom);
    String factFoodfusion = JsonParser.parse(resultFoodfusion).get("statusCode");
    if (!"OK".equals(factFoodfusion)) {
        //repeat booking
    } else {
        //locationToNavigate = this restaurant
    }
} else if (selectedResuarant.equals("Hathaway") {
    String name = "John";
    String number = 1;
    String email = "john@gmail.com";
    Date date = Date.now;
    String resultHathaway = call("https://api.hathawayfood.com/booktable", name, number, email, date);
    String factHathaway = JsonParser.parse(resultHathaway).get("statusCode");
    if (!"OK".equals(factHathaway)) {
        //repeat booking
    } else {
        //locationToNavigate = this restaurant
    }
}
}
//navigate to locationToNavigate

```

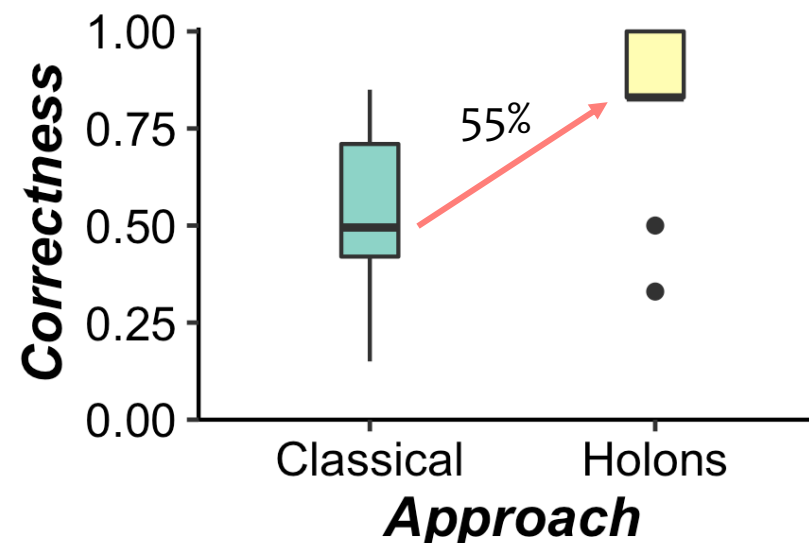

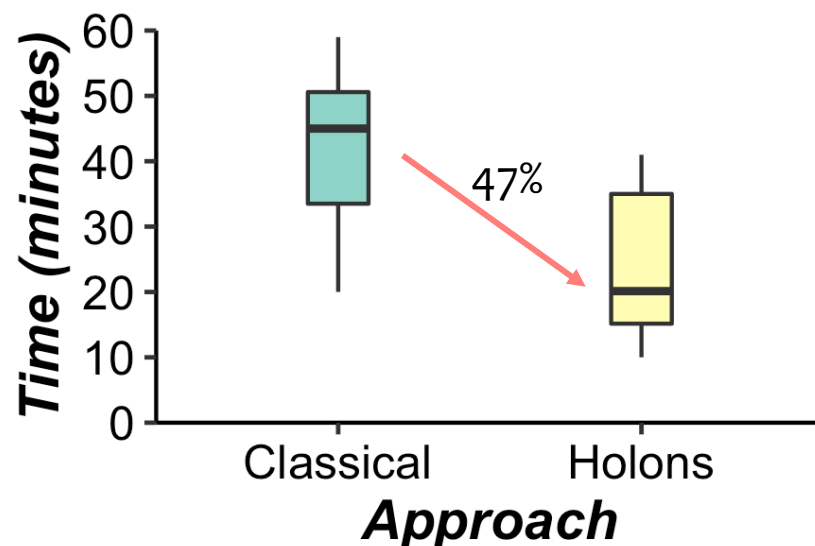

Sample Response – Holon DSL

```
String vehicleResult = call("http://holons/registry/getHolon?holonID");
vehicle= Holon.parse(vehicleResult);
connection = vehicle.call(AUTHENTICATE);
fuel= vehicle.call(CAR_RANGE);
threshold = 5;

if(fuel < threshold ) {
  String stationResult= call("http://holons/registry/getHolon?type=station&longitude=longitudeValue&latitude=latitudeValue");
  fuelStation= Holon.parse(stationResult);
  echo "Fuel Station";
}

String restaurantResult= call("http://holons/registry/getHolon?type=restaurant&longitude=longitudeValue&latitude=latitudeValue");
restaurant= Holon.parse(restaurantResult);

restaurant.call(BOOK_TABLE);
```

Graphical Workflow – HolonCraft

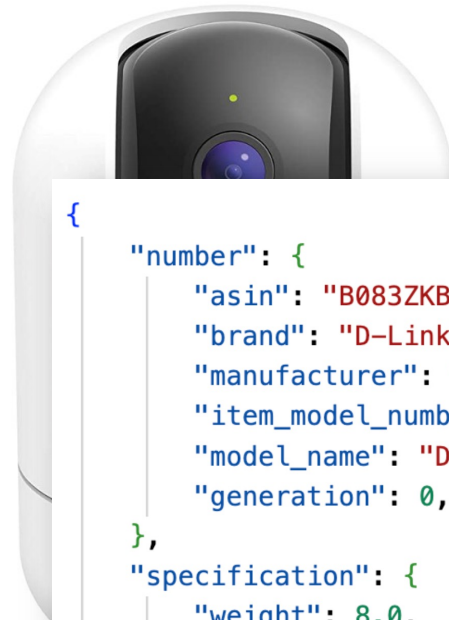

The screenshot displays the HolonCraft graphical workflow editor. On the left is a sidebar with categories: Events, Sensors, Actuators, Services, Logic, Loops, Math, Text, Lists, Variables, and Functions. The main workspace shows a 'Blinking' function block (purple) with a 'repeat' loop (green) containing a 'for each item' loop (green) and a 'wait for 1 second' block (blue). The 'for each item' loop contains an 'if' block (blue) with 'switch off' and 'switch on' blocks (blue) for 'Light' objects. Below it is a 'Scene warning' block (green) with a 'Blinking' block (purple) and a 'create list with' block (purple) containing 'Light1', 'Light2', and 'Light3' objects. The 'Times' parameter is set to 100. On the right is a console window showing the Python code for the 'Blinking' function and a 'warningscene_event_callback' function. The console also shows the user name 'Jim Gao', a 'Task Sheet' link, a 'Help(Tutorial)' link, a 'Choose a task:' dropdown set to 'Task3', and 'Start' and 'Finish' buttons. The console output shows the execution of the 'Blinking' function and the 'warningscene_event_callback' function.

```
1 Lights = None
2 Times = None
3 Light = None
4
5 # Describe this function...
6 def Blinking(Lights, Times):
7     global Light
8     for count in range(int(Times)):
9         for Light in Lights:
10            if (Light.is_on()
11                ) == True:
12                Light.switch_on(False)
13            else:
14                Light.switch_on(True)
15            time.sleep(1)
16
17
18 def warningscene_event_callback():
19     Blinking([actuator["light1"], actuator["light2"],
20              actuator["light3"]], 100)
```

Parameters

Key-value pairs that include parameters and device properties

Functional Description

Several paragraphs of unstructured text, describing the functions of the device

ight Vision, Motion Sensor

ny time with full HD 1080p video at a smooth 30 frames per second (180° horizontal and 40° vertical) and tilt (100°) to see the whole room or have the camera zoom in on specific viewpoints

View, save, and share video from the cloud, your own MicroSD card, or a PC. Requires a compatible device. Free and paid cloud subscriptions available

ion right from your lock screen. See snapshots, view live video, and speed dial to the app

an activity zone around a door or hallway to only receive the alerts you want

camera fully retracts its lens when set to privacy mode for complete peace of mind

up: Place it where you need it and set up in minutes with the mydlink app

plugs are designed for use in the US. Outlets and voltage differ from other countries. An adapter or converter may be required for use in your destination. Please read the manual before purchasing.

Knowledge Extraction

- Robustly optimized BERT approach (RoBERTa), a model using the Stanford Question Answering Dataset (SQuAD.o)
- Experiment on 140 devices
 - Learning rate: 5e-5
 - Batch size 32, Epoch 20

	Precision	Recall	F1
Parameter	98.17%	94.81%	96.11%
Function description	94.64%	78.00%	84.19%
Overall Holon description	96.72%	87.53%	91.90%

#	Device Category	Number of Devices
1	Smart camera	28
2	Speaker	17
3	Smart plug	16
4	Smart bulb	15
5	TV	15
6	Sensor	11
7	Smart coffee maker	8
8	Smart cooker	8
9	Smart washer	7
10	Smart refrigerator	5
11	Smart vacuum cleaner	5
12	Smart toilet	5

Challenges

- IoT-motivated ontology
 - Evaluated in contexts like smart home, IoV, etc.
 - Cross ecosystem boundaries
- Discovery through announcement
 - Architecture relies on systems advertising themselves
 - Passive discovery still possible, but more challenging
- Trust
 - Assume that it is safe to compose
 - Assume that we are not compromising inherent system
